

Which Scenarios Need to be Tested to Ensure Automated Driving Safety and Why?

A new methodology applying a coupled traffic and vehicle dynamics simulation

Level 2 System

- Partial Driving Automation

Object and event detection
and response

Level 3 System

- Conditional Driving Automation

 **Need of validation and safety proof of the vehicle + intended functionality of automated driving system within predefined operational design domain**

* **Automated Driving System**

Sources: Wachenfeld, W.; Winner, H.: Die Freigabe des autonomen Fahrens (2015); SAE International: SAE J3016 (2018)

- Statistical, distance-based proof of safety cannot be accomplished by physical testing
 - Autobahn-Chauffeur $\rightarrow \approx 6$ Billion test kilometres
- Scenario-based approach
 - Reduction of test effort through identifying and testing exclusively critical scenarios
 - Test effort still exceeds existing capacity in practice
 - Functional scenario *cut-in* $\rightarrow S_N \approx 8 \cdot 10^{23}$

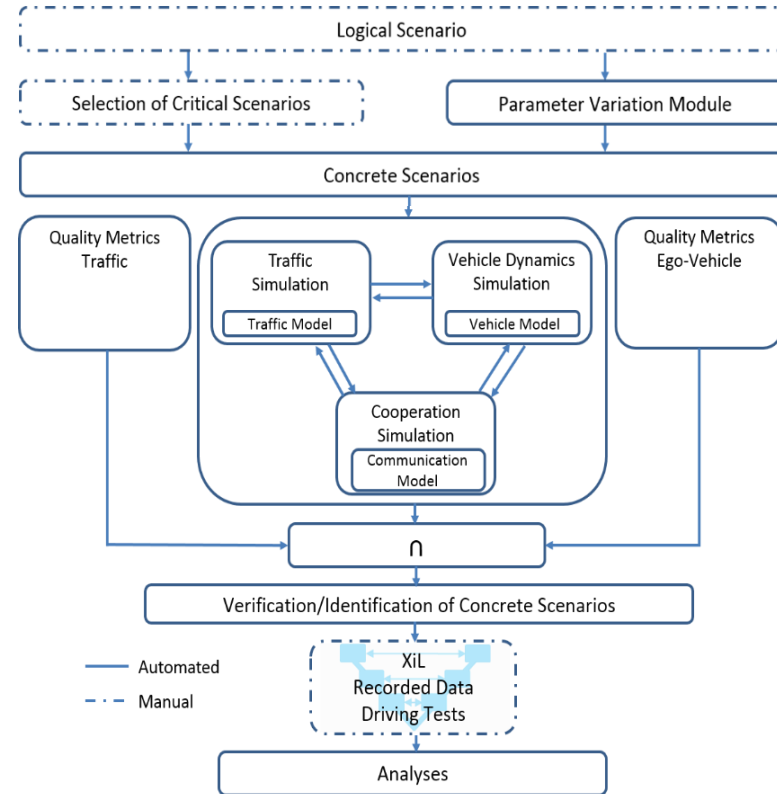

Need of further parameter space reduction

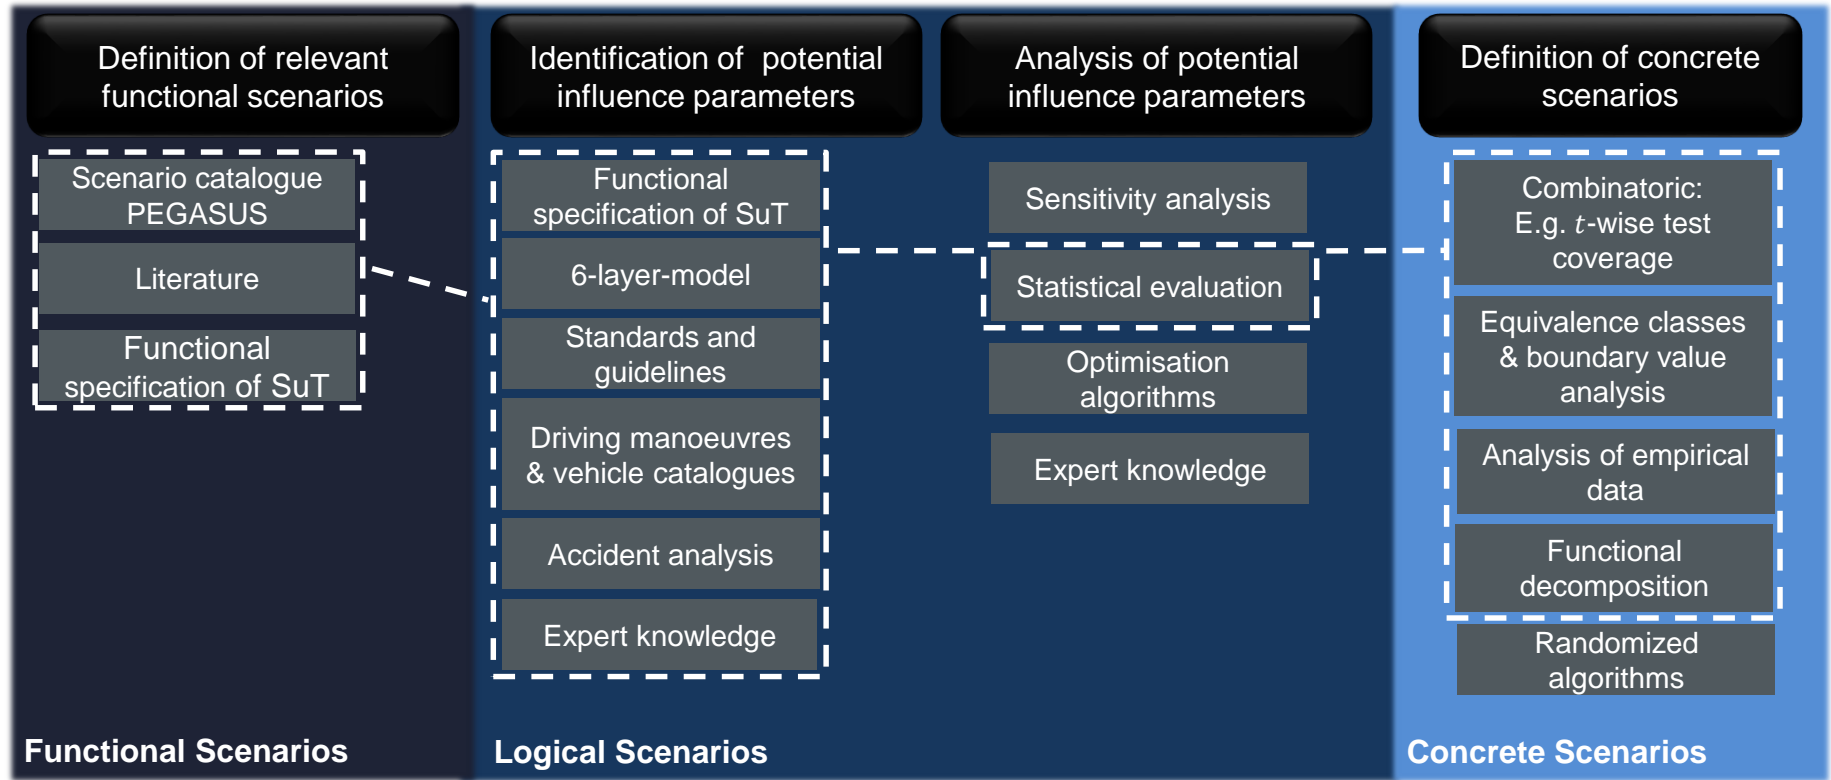

Source: Amersbach, C.; Winner, H.: Functional decomposition (2019)

- Motivation
- Methodology
- Results
- Conclusion & Outlook

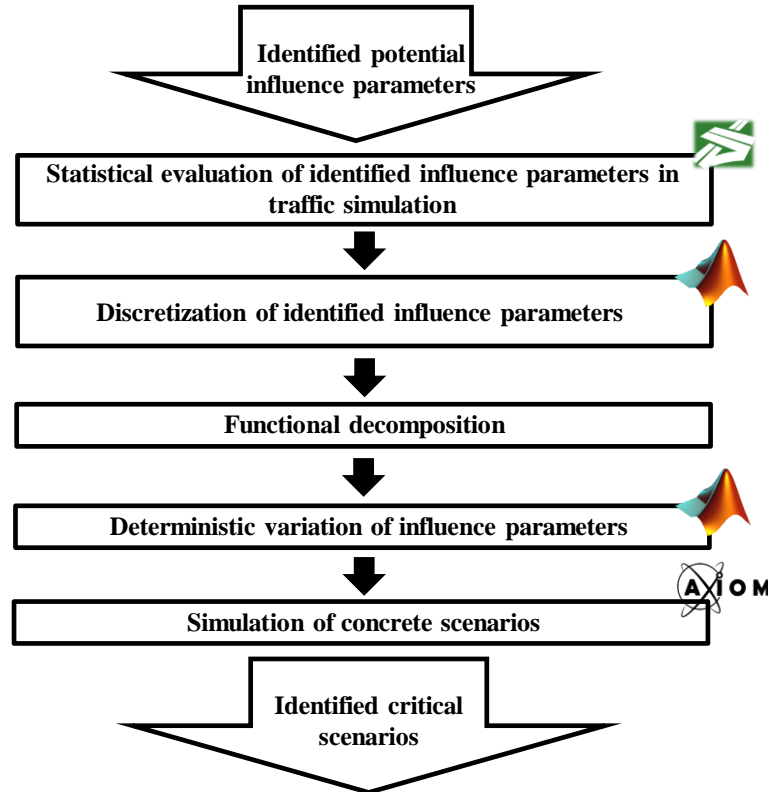

- How to transfer functional scenarios into concrete scenarios as input for the coupled simulation?
 - in a systematic way
 - while reducing the parameter space

Source: Weber, N. et al.: Simulation-based approach for the derivation of concrete scenarios (2020)

Prediction of occurrence probabilities and value ranges by expert knowledge seems to be extremely challenging

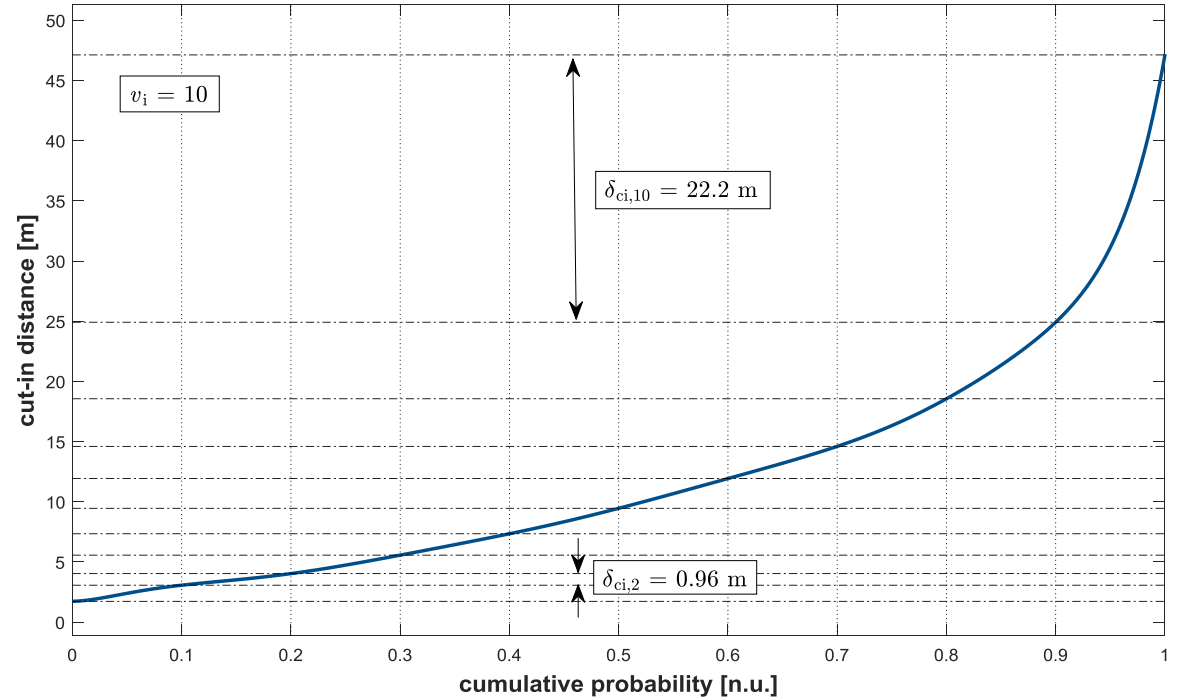

Source: Weber, N. et al.: Simulation-based approach for the derivation of concrete scenarios (2020)

- Discretization

Equidistant division of cumulative probability

Variable discretization in absolute value range

Source: Weber, N. et al.: Simulation-based approach for the derivation of concrete scenarios (2020)

- Functional Decomposition

Reduction factor
 → 45 for 3-wise
 → 30 for 10-wise
 test coverage

Source: Weber, N. et al.: Simulation-based approach for the derivation of concrete scenarios (2020)

- Functional Decomposition

Dimension of remaining test suite is still challenging

| t | $S_{t, \text{System}}$ | $S_{t, \text{part.}}$ |
|-----|------------------------|-----------------------|
| 3 | $1.4 \cdot 10^6$ | $3 \cdot 10^4$ |
| 10 | $9 \cdot 10^{13}$ | $3 \cdot 10^{12}$ |

Source: Weber, N. et al.: Simulation-based approach for the derivation of concrete scenarios (2020)

- Deterministic parameter variation

Median-based definition of parameter values within discretization stage $\delta_{ci,i}$

Test suite definition through entirety of parameter values over all influence parameters and functional scenarios

Source: Weber, N. et al.: Simulation-based approach for the derivation of concrete scenarios (2020)

- Quantifiable reduction of parameter space by a factor between 30 and 45 depended on the test coverage is achieved
- Second non-quantifiable reduction effect through limitation of value range of identified influence parameters
- Developed methodology allows a systematic derivation of concrete scenarios
- Time saving factor of ≈ 2000 illustrates potential of simulation-based approach

- Increase the number of considered functional scenarios
- In-depth investigations regarding model plausibility and microscopic traffic conditions
- Examination if there are other factors in addition to the occurrence probability, which influence the relevance of a scenario
- Benefit analysis of hybrid-reality approaches like Prototype-in-the-Loop
- Investigation of applicability of methodology in urban areas

Many thanks for your attention!
