System

ZF is developing a modular and scalable autonomous driving Hard- and Software solution which meets the requirements for Level 4 Systems

Simulation Framework Architecture

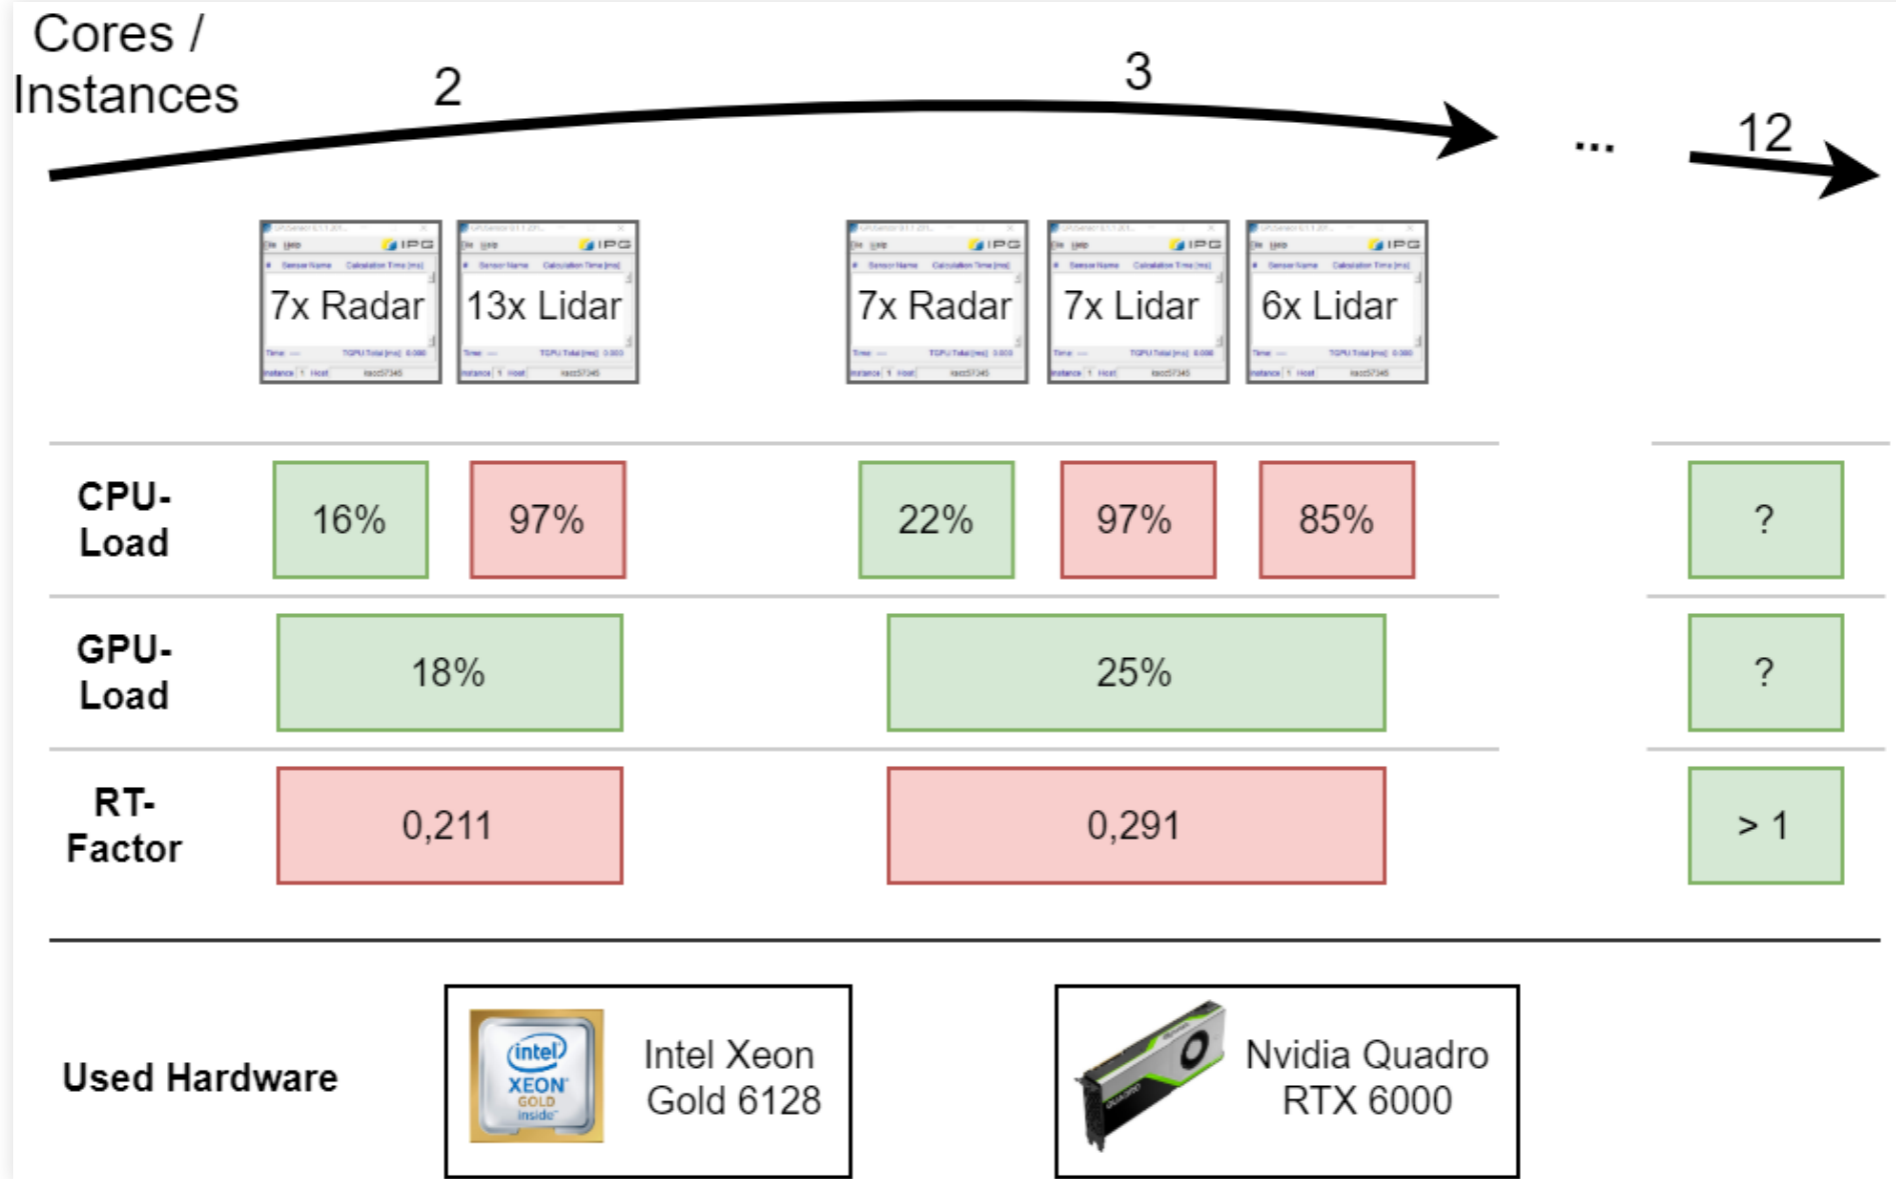

MEASUREMENT BASED APPLICATION AND INVESTIGATION OF HW AND SW REAL-TIME BOTTLENECKS OF A ZF SENSOR SET IN A CARMAKER-HIL SIMULATION FOR AUTONOMOUS DRIVING

1. ZF SENSORSET FROM SIL SIMULATION

2. FIRST TRIALS WITH SIL INCL. RT-FACTOR-MEASUREMENTS

3. ARCHITECTURE WORKSHOP WITH NI& IPG INCL. PROOF-OF-CONCEPT WITH MEASUREMENTS OF VDS STREAMS - FINAL HIL-ARCHITEKTUR

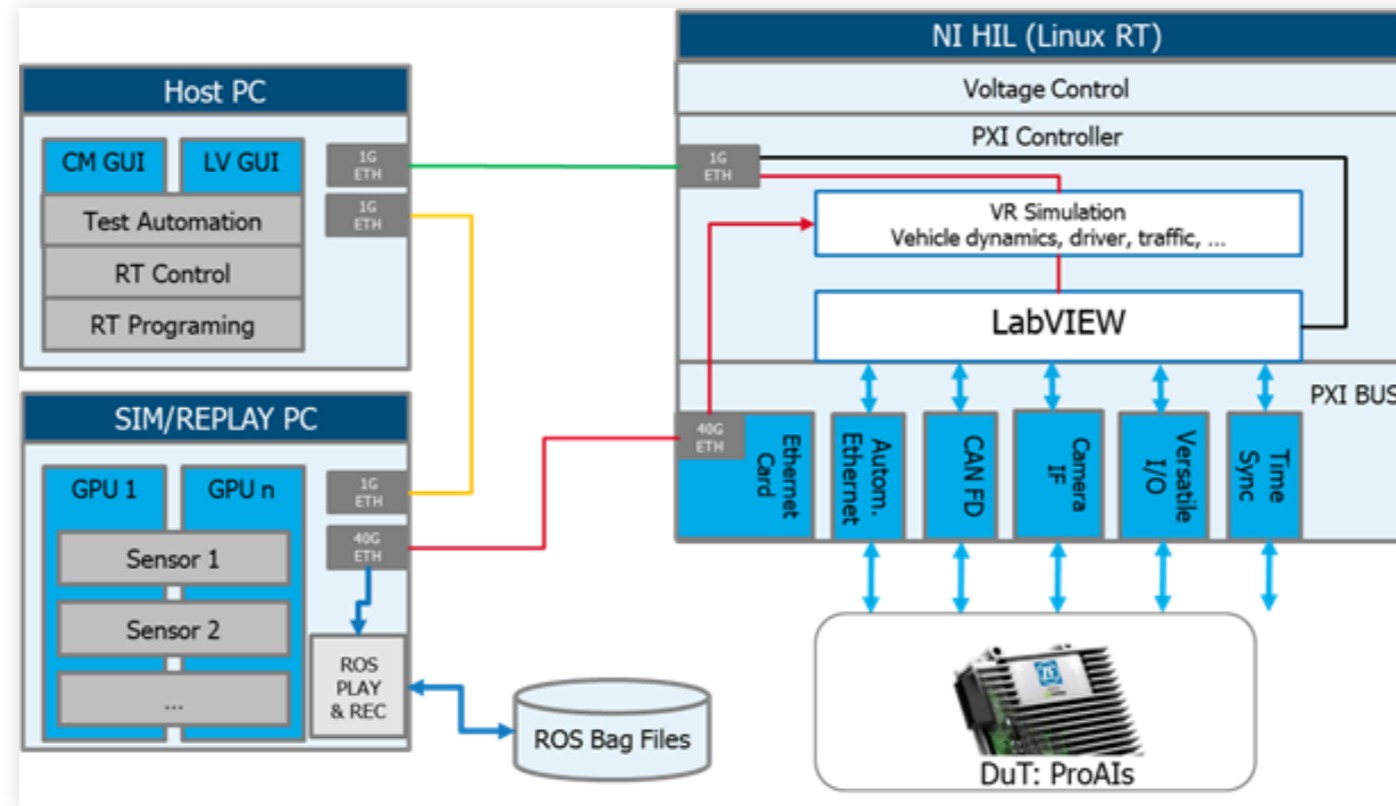

Fig. 1 Hard- and Software architecture of AD System HIL

4. RESULTS OF PERFORMANCE EVALUATION ON FINAL HW SETUP AND FIRST SHOWCASE

	Cores / Instances 12	2	10	//24
				
	4x Lidar	7x Radar	10x Camera	
CPU-Load	12x 27%	2x 48%	10x 100%	
GPU-Load	12x 662 MiB	2x 150 MiB	10x 1400 MiB	
RT-Factor	> 1			
Used Hardware	2x  Intel Xeon Gold 6244	3x  Nvidia Quadro RTX 4000		

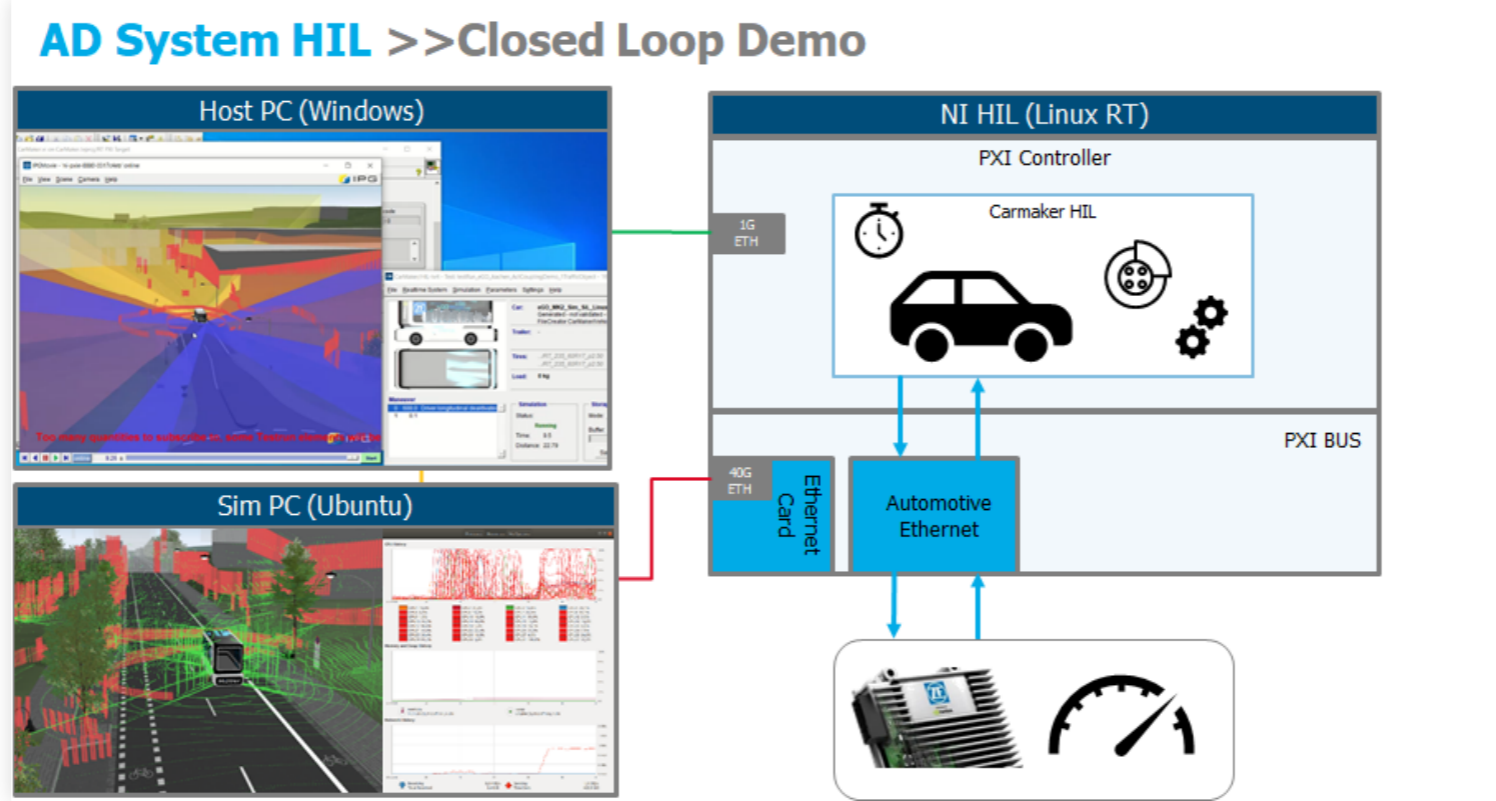

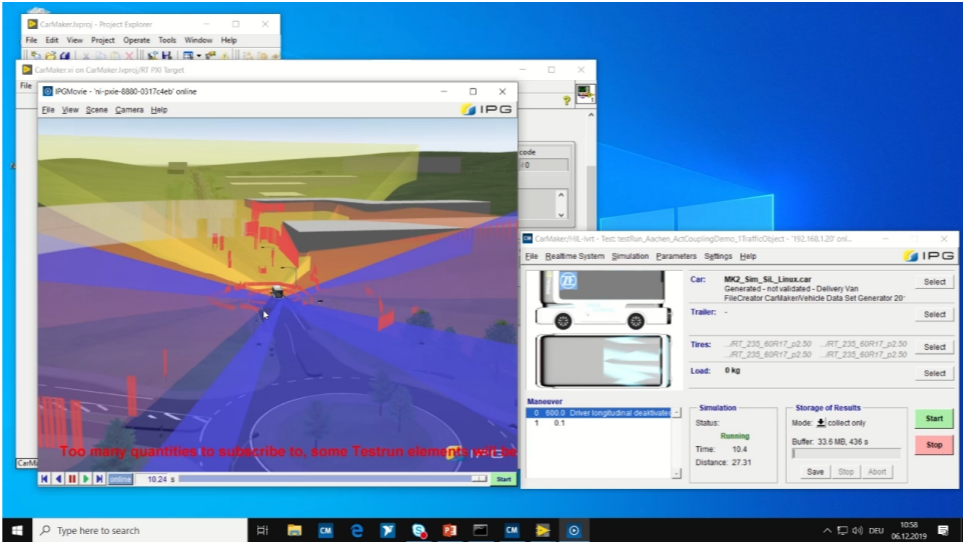

Fig. 2 Visualisation of Closed-Loop Simulation with CarMaker HIL and performance measurements parallelly running

5. OUTLOOK

Measurement based and analytical studies to see if the QoS & RT-Requirements of the HiL-System are fulfilled!

- **Verify reliability and RT-capability of Ethernet Connection with Wireshark measurements:**
 - APO and UDP
 - TCP
 - DDS and UDP
 - Stresstesting with MitM or Spoofing attacks
- **SIL simulation to find out the real-time capabilities of a CarMaker scene before running on HiL**
